

Task 3: Sync Vehicles Between Business Central and Dataverse

As part of our **Rent-a-Car** solution, we want to set up **custom data synchronization** between the Vehicle table in **Business Central** and a custom Vehicle table (entity) in **Dataverse**.

This task will guide you through:

- Creating a custom Dataverse entity
- Using altpgen to generate the integration table
- Subscribing to events in AL to trigger sync logic

Steps to Complete

1. Clone the Business Central Rent-a-Car App

- Repository: [mmilince/template-bctechdays-2026-2](https://github.com/mmilince/template-bctechdays-2026-2)
- Open the solution in Visual Studio Code and review the Vehicle table and related logic.

2. Create a Custom Vehicle Table in Dataverse

- Fields to include:
 - Number (Text)
 - Type (Choice: Car, Motorcycle, Van)
 - Fuel (Choice: Gasoline, Diesel, Electric)
 - Loaned (Boolean)
 - Model (Text)
 - Make (Text)
 - Year of Manufacturing (Integer)
 - Mileage (Decimal)
 - License Plate (Text)

- You can use the Power Apps Maker Portal to define this entity.
 - 3. **Generate AL Integration table Using altpgen tool**
 - Register a new App Registration in Azure portal
 - Use altpgen to generate vehicle integration table in AL
 - 4. **Create a page based on integration table**
 - Implement logic to push changes to Dataverse using the integration table you created.
 - 5. **Enable synchronization and coupling between Vehicle in Business Central and Dataverse**
 - Add missing logic in **HandleOnGetCDSTableNo** procedure inside the “**Data Sync Mgt**” codeunit
 - Add logic to use a page for coupling Business Central records with records from Dataverse (add missing logic to **HandleOnLookupCRMTables** procedure)
 - Enable deep linking between coupled records (add your code in **HandleOnAddEntityTableMapping** procedure)
 - Create default table and field mappings (add your code in **HandleOnBeforeResetConfiguration** procedure)
 - 6. **Add actions on “Vehicle list” page for managing coupling and synchronization**
-

Hint

- Parameters needed for altpgen: [project](#), [packagecachepath](#), [serviceuri](#), [entities](#), [baseid](#), [clientid](#), [redirecturi](#)
- Make sure you have appropriate permissions on both the Dataverse environment and Azure app registration.
- If you have issues with adding custom logic, take a peek of a solution in github repo on the **solution/data-sync** branch

Bonus Task

Set up similar synchronization for **Contact (Business Central)** and **Contact (Dataverse)**.

- Add a new field **Membership ID** in the **Contact** entity in Dataverse.
- Use the **altpgen** tool to generate the integration table
- Map and sync the data using appropriate event subscriptions.
