

# Business Events and External Integration

This task consists of two parts. In the first part, you'll create and test a custom **business event** that integrates with an **external system**. In the second part, you'll define two custom business events related to our **Rent-a-Car** scenario.

---

## Part 1: Notify External System on IBAN Change

We want to notify an external system whenever the **IBAN field** on a **Vendor Bank Account** is changed. You'll create a custom **Business Event**, set up **App Registration**, and configure subscription with **Postman**.

### Steps to Complete

#### 1. Create a Custom Business Event

- Trigger the event when the **IBAN** field is changed on a vendor bank account.

#### 2. Create and Configure App Registration

- Register a new app in **Azure Portal** for API access.
- Set the necessary permissions and copy the credentials (Client ID, Tenant ID, Secret).

#### 3. Subscribe to the Event using Postman

- Use the **/externaleventsubscriptions** BC API endpoint (you can check all available business events at **/externalbusinesseseventdefinitions** endpoint)
- Send your subscription request from **Postman** (if having difficulties, import postman collection and take a look. HINT: use **clientState** property in body of the request and put your name in it).
- For **notificationUrl** property use: <https://webhookazure-gmcxbacqerbpe3f3.norwayeast-01.azurewebsites.net/api/WebhookAzure>

## Part 2: Create Custom Business Events for Rent-a-Car

Define two custom Business Events related to the loan process in the Rent-a-Car app.

## Events to Implement

### 1. VehicleLoaned

- Subscribe to the event: **OnAfterLoanVehicle**
- Trigger a Business Event named VehicleLoaned
- Pass the following parameters:
  - Loan Order No.
  - Contact No.
  - Contact Name
  - Contact Email
  - Vehicle No.
  - Vehicle Name
  - Document ID

### 2. VehicleReturned

- Subscribe to the event: **OnAfterReturnedLoanLineCreated**
- Trigger a Business Event named VehicleReturned
- Use the **same parameters** as above.

---

## Hint

- Make sure to add EXT. EVENTS – SUBSCR permission set to Microsoft Entra app
- If you have difficulties, take a peek of a solution in github repo on the **solution/business-events** branch
